

Auckland Airport

Project Data Sheet

Major refurbishment at Auckland Airport

As New Zealand's premier gateway airport, Auckland Airport has undergone major refurbishment to enhance New Zealand's reputation as a world-leading tourism destination for the increased passenger volumes.

Computronics supplied InterSystems with a series of state-of-the-art Flight Information Displays (FIDs) for Auckland Airport that were installed throughout the terminals in both International and Domestic Airports.

Auckland Airport is critical to New Zealand's tourism and transport infrastructure. The board and management remain dedicated to the long-term growth of our airport, such that it provides safe and secure services, and meets or exceeds all of the requirements of its customers and other stakeholders.

John Maasland, Chairman, Auckland Airport

Installation Date: Mid 2007

Flight Information is made easy by the FIDs which combine multiple LCD screens, showing full colour airline logos, together with LED details.

The scrolling bottom line on the display updates travellers with important messages from airport management.

Key features:

- Tri colour LEDs – red, yellow, green
- Airline logo: multiple LCD Screens
- Flight information: LED multi line displays
- Digital LED Clock
- Scrolling information line
- Controlled by InterSystems Airport Management Software interface

For further information about this project or other electronic display solutions, visit our website, www.computronics.biz or contact Computronics on 1300 888 506 (within Australia).
